

A woman and a young girl are looking at a plant in a decorative pot. The woman is on the left, looking down at the plant. The girl is on the right, looking at the plant with her eyes closed. The plant is a green, leafy herb. The pot is white with a star-like pattern. The background is blurred green foliage.

Water sensibly and efficiently: In all areas of your garden. With automatic watering you have more time to relax and enjoy.

Saving water and money? And still have more time for fun activities you enjoy? That's possible with GARDENA: It doesn't matter if you want to grow your plants in the garden, on the balcony or on the terrace. Get Europe's No. 1 irrigation brand and treat yourself to some rewarding moments with just one click. Switch from vigorous gardening duties to enjoyment mode while your plants are flourishing.

Plant areas: Raised beds and vegetable beds

The GARDENA Micro-Drip-System ensures that your plants germinate, grow, blossom and flourish. By watering exactly at the root of the plant.

Page 24

Plant rows: Hedges & shrubs

Watering for plant growth and well-being. Hedges and shrubs, border plantings or plant borders are irrigated in a sustainable manner.

Page 28

Potted plants: Balcony & Terrace

Well looked after. Now your plants are watered automatically and efficiently. Every day. Even when you are on vacation.

Page 18

The heart of auto- matic watering: The Irrigation Control

Now water is supplied to all areas of your garden. No matter the time, water requirements or which system. It liberates you to have the control for everything to run smoothly.

Page 42

Lawn

Achieve a green and lush lawn with a Sprinklersystem. Discover the elegant and efficient lawn care solution that is even water-saving. Underground installed sprinklers get the hard work done and disappear when not in use.

Page 32

Underground Water Network

Always be connected to the source. Thanks to this invisible underground Pipeline solution, you have access to water wherever you need it.

Page 38

Why investing in intelligent, automatic watering is worthwhile?

Always, but especially when the world is changing, a green space is good for you.

Let's care for them and expand green spaces. In cities, the countryside, the garden, on the terrace or on the balcony.

Discover your sustainable watering solution. After all, GARDENA technology benefits people and also plants.

Healthy plants and greener lawns ...

are proof of watering your garden correctly. Thanks to automatic irrigation it is a piece of cake to keep your garden areas beautiful and lush.

More time to relax ...

while the system takes care of the irrigation in your garden. Thanks to automatic watering you have more time to relax on the terrace, balcony or among beautiful flower borders and vegetable beds.

Conserve resources ...

by switching from manual to automatic watering. Automated and precise irrigation is much more efficient. You can save up to 70 % of the water while your garden thrives. Every drop counts.

Adaptable & clever ...

from small to large lawns, from flower pots on the balcony to raised beds in your garden: GARDENA offers customised and intelligent solutions, which can be conveniently adapted to all your watering needs.

Did you already know, ...

... that plants absorb water from the soil with the help of its roots?

Plants consist of approx. 80 to 90 % water and would no longer be able to survive without water. Water dissolves nutrients in the soil, which are transported upwards to the plant via the roots to support growth and other metabolic processes, including photosynthesis.

... the water requirement varies greatly from plant to plant?

The lettuce in the vegetable patch, the hedges in front of the house and the lavender on the balcony - they all need to be watered at different intervals and with different amounts of water.

... that there are four stages of the warning signs of plant thirst?

Dark green, bluish coloured lawns or plants with withered and dropping leaves are typical signs of acute water shortage. Garden experts distinguish between four phases of a plant's drying out: incipient thirst, acute water shortage, wilting and death. You can find the warning signs on page 13.

... that drought stress reduces photosynthesis, growth and survival of the plant?

Drought stress mainly occurs when water demand exceeds the available amount of water available or when the transpiration rate rises sharply including water deficit, drought and high salinity in the soil.

Hortensie
(Hydrangea macrophylla)

4 to 5 litres*

Prefer it regularly
damp to wet.

Lavender (Lavandula)

Prefer to be dry than too moist. Ensure good water drainage, so that no water-logging occurs.

Lemon (Citrus limon)

3 to 4 litres*

Rarely but thoroughly, avoid waterlogging. In winter keep dry.

... that too much water can have a negative impact on plant growth?

There is often a tendency to water more than necessary when a plant shows warning signs of thirst. The already stressed and weakened plant roots would deteriorate even quicker due to access to insufficient oxygen.

... that the best time to water is in the morning?

The soil has cooled down overnight and absorbs the water well. In the blazing sun the water would evaporate immediately.

... that you can reduce up to 70 % water consumption compared to conventional irrigation techniques?

Automatic irrigation conserves this precious and valuable resource and gives the plants exactly the right amount of water they need - not too much or too little. Precise watering enhances your plants growth, making them more beautiful and healthier and providing you a richer harvest.

Tip

Without water you cannot achieve a healthy garden. Discover our range of Water Controls that transport water just at the right time. No matter if you want to irrigate one particular area or your entire garden. GARDENA offers a range of Water Controls that are directly connected to a water tap.

The multi-channel Irrigation Control will be heart of your garden that waters different areas separately with individual watering schedules, e.g. lawn, flower boxes or vegetable beds. Now each area will get the right amount of water at the right time.

Heather

(Calluna vulgaris)

3 litres*

Water regularly on warm days in autumn.

10 tips for clever watering

How you can save time and money through needs-based watering.

1

Keep consistently moist

Most plants are dependent on a constant soil moisture level. Drip irrigation saves water, because with each drop, you're targeting water to the roots. The result: vigorous growth, a better yield and more beautiful, healthier plants.

2

Watering economically

For a flower bed, one or two waterings a week is usually sufficient. Use as much water as necessary and as little as possible. This can be achieved using an automatic irrigation system with moisture sensor in the bed, on the balcony or in the lawn. The sensor is your reliable guide, as it skips irrigation schedules when the soil is moist. Just insert it in the soil and know for sure whether the plants need water or not.

More on page 45

3

Watering the roots

You should water the roots and not other parts of the plant. This is where it matters the most. Too little water often only wets the surface of the soil, e.g. when mulch is applied. With the Micro-Drip-System, you water the plant efficiently and precisely directly at the root. Crops depend on even soil moisture in their ripening phase before harvesting. This is especially important for the formation of roots and tubers of carrots or potatoes, leaves of basil, heads of cauliflower or lettuce, pods of beans or fruits of tomatoes or fruit.

Wrong:

Only the top layer of soil is soaked, the roots do not get any water

Better:

The soil is well moistened, Water penetrates deeper to the roots

4

Water early in the morning

The soil cools down at night. If you water in the morning, less water evaporates compared to watering on hot soil. Your plants are able to absorb sufficient water before the soil heats up during the day. Let a Water Control take charge of the watering schedule and irrigate your plants at the right time: While you sleep, it takes care of the watering duration and frequency based on a pre-defined schedule.

5

Keep the leaves dry

Plant diseases are always a cause for concern for gardeners. Wet leaves are more susceptible to sickness. If left wet overnight, fungal infections may arise. Therefore: Try not to wash off the leaves when watering, but water the root area. The Micro-Drip-System waters the plant precisely and directly at the roots.

6

Avoid waterlogging

Waterlogging prevents the roots from breathing. The roots drown without oxygen. Therefore, a soil moisture sensor is the ideal solution to identify soil that is too wet. If this is the case, simply skip a watering cycle.

7

Use rain water

Collecting rain water conserves drinking water. This is good for both your wallet and for the plants. Plants love the fact that rainwater is warmer than tap water and has a lower calcium content.

More on page 31

8

Use high-quality clay-rich soil

Earth containing a lot of clay minerals retains water better due to its ability to swell, providing the plants with a more consistent supply of water. A good quality top soil ensures excess water can drain away during wet summers and in winter thus preventing waterlogging. Loam and humus are also good at retaining water.

9

Group plants together

Grouping plants according to their needs allows for more efficient watering. Modern water controls take into account the needs of different watering zones and required watering methods.

10

Regional plants

Growing indigenous plants requires less effort, fertiliser, pesticide – and water. "Old" varieties adapted to the local conditions are more suitable than over-bred global hybrid cultivars. But there are other locally cultivated plants that have adapted to the domestic climate.

5 steps to a beautiful lawn

A good soil is the basis

The ideal basis for lawns is also a loamy sandy soil. Nutrient-rich humus as a root base ensures good growth. If in doubt, it even pays to remove poor topsoil and replace it with new soil.

The lawn type makes the difference

Here it is worth investing a little more in a high-quality mixture - for a healthy, weed-free lawn. You avoid grass varieties that do not meet the usual quality criteria this way. Ornamental lawns, play lawns and utility lawns are recommended. The last mentioned is one of the most frequently sold types, because it is resilient and looks good at the same time. Ornamental lawn has finer-leaved grasses that grow close together, which makes it look particularly beautiful carpet-like.

Mow and scarify once, please!

Our lawn needs to be cared for. That means mowing and verticutting. When mowing, you should make sure not to cut off more than a third of the leaf volume. Experts recommend a cutting height of 35-45 mm. With the GARDENA SILENO, you cut the grass cleanly with precision blades and reliably achieve the desired cutting height. The fine cuttings act as a natural fertiliser on the lawn. This promotes healthy growth and saves precious time in which you can do what you like to do. Do you want the best possible care for your lawn? Then you should verticut it once a year. To do this, mow the lawn as deep as possible to a height of approx. 20 to 30 mm.

Fertilising keeps your lawn in shape

Good nutrients keep you healthy - this also applies to your lawn. Too few nutrients lead to visible deficiency symptoms. And that's exactly the risk when mowing and removing the grass. The lawn loses leaf mass and important nutrients. If the nutrient deficiency becomes too great, it slows down its growth, begins to discolour and becomes more susceptible to disease. To make matters worse, the reduced nutrient content of the soil can also make it easier for undesirable herbs to take root. To avoid this, fertilise the lawn, ideally before it starts to rain. If it does not rain, you should water the lawn so that it does not "burn". You can save about a third of the fertiliser by mulching the lawn if you leave back the clippings on your lawn. Robotic mowers mow so frequently that the clippings are always small. Classic mowers have mulching blades that shred the clippings and then leave them lying around.

Water - the recipe to achieve a beautiful lawn

Finally, it is always the right watering that determines how healthy and green your lawn is. Here, too, the rule is: Clever watering! Use the GARDENA Sprinklersystem, a complete system, consisting of Pop-up Sprinklers, Pipes and Connectors as well as the matching Irrigation Control (see p. 32).

Warning signals of dried out plants

Flowering plants

Lawn

Incipient thirst

1 Stage

- Plant feels slightly flaccid
- Leaves curl up slightly, some drooping

- Trodden-down blades don't stand up again by themselves for a long time

Acute lack of water

2 Stage

- Withered, drooping leaves
- Lush green begins to fade

- Deep dark green, bluish tinge
- Lush green begins to fade

Withering

3 Phase

- Very wilted, dry leaves, flower heads and stems
- Yellow to brownish leaf tips

- Curled-up blades
- Yellow or light brownish tips of the blades of grass

Death

4 Stage

- Yellow or brownish leaves
- Dry stems
- Plant usually beyond saving

- Large patches of yellow or brownish lawn
- Lawn may need repairing

Micro-Drip-System: Caring for your plants and every precious drop.

Watering precise at the root

From now on the Micro-Drip-System irrigates for you! The Micro-Drip-System is an automated watering solution that is growing in popularity. The increase in demand is undoubtedly linked to hotter and drier summers and changing perception to this scarce resource in our society.

There are key sustainable advantages that make this solution unbeatable: You can save up to 70 % of water through targeted watering directly at the root of the plant. The system is installed in no time. So if you want to water more plants with the Micro-Drip-System, this can be done in just a few steps - thanks to the patented Quick & Easy connectors. Your plants will be supplied with exactly the right amount of water at the right spot.

The result is beautiful and healthy plants.

Plant areas: Raised beds and vegetable beds

Are you considering watering plant areas?

Do you want to water entire beds of lettuce, beans, strawberries or shrubs?

Discover the suitable irrigation solution based on the type of plants and setting of the plants in the bed. Based on the watering needs of your plants you can select from a range of Micro-Drip Drip Heads and Spray Nozzles. In combination with a Water Control and Sensor you can optimise the irrigation process even more.

More see page 24

Potted plants: Balcony & terrace

With conventional watering, the plant often receive too much water. Micro-Drip Drip Heads, on the other hand, carefully transport water directly to the root of the plant over a defined period of time. It is the ideal invisible irrigation solution for your potted plants.

More see page 18

Plant rows: Hedges & shrubs

For hedges and rows of plants, you lay a dripline that supplies the plants with water above or below the ground. The underground installation is particularly ideal for permanent plantings while above ground installation of the dripline are best suited for annual plantings. With the Micro-Drip-System you water directly at the roots. This way you avoid overwatering and the soil does not get too wet.

More see page 28

Easy and convenient ...

Thanks to the Quick & Easy connection technology the Micro-Drip-System is very easy to install. There is no prior knowledge needed. The drip irrigation starts with the Watering Control which is installed directly at the tap. From there, the water flows through the Master Unit to driplines and connectors, transporting it to directly to the plants in the desired sections in your greenspace, such as plant areas, potted plants or plants rows. Drip Heads and Spray Nozzles are individually placed along each plant. Drop by drop the water is directly transported to the root of the plant. Select from a range of options to either manually or automatically irrigate your plants. GARDENA even enables you to control the irrigation schedule from the comfort of your smartphone.

What do you want to irrigate?

Potted plants
in planters

Endline Dripper

Planters and raised beds

Quickly explained & quickly installed

You can easily install the Micro-Drip-System yourself. You can find more information on installation in the DIY section on page 66 or watch the online videos. In no time you will supply your plants comfortably and efficiently with this precise and sustainable plant irrigation solution.

How to step up and control your Micro-Drip-System

Only you know what works best for you and what your garden needs. From automated irrigation with Water Control installed at the tap, to intelligent watering with Water Control and Soil Moisture Sensor to smart watering via the GARDENA smart App with the smart Water Control and smart Sensor. Everything is possible. Explore all available options and discover an automatic watering solution with the ideal comfort level for your needs.

★

Directly at the tap

Basic and flexible to install and use. First you need the Master Unit 1000 or Master Unit 2000, which regulates the pressure and filters the water. Connect the Connecting or Supply Pipe directly to the Master Unit. You easily regulate the constant water supply by actively turning on and off the water tap.

★★

With Water Control

Water reliably and conveniently by automating the watering schedule with the GARDENA Water Control. You can easily define and set the days, duration of the watering cycle and exact timings on the units itself. The Water Control then takes care of everything without any need of interference. Discover our range of models and select the system that is best suited for the needs of your garden.

More on page 46

★★★

With Water Control and Soil Moisture Sensor

You can also combine your Water Control with the GARDENA Soil Moisture Sensor. It is directly connected to the Water Control via a cable and reliably measures the soil moisture. Especially after longer periods of rain the soil is very moist. The Sensor would signal this to the Water Control and a pre-defined watering schedule will automatically be skipped. Thus water is saved and the plants receive the best care.

More on page 46

★★★★

With smart Water Control and smart Sensor

Irrigate the smart way. This is the most water-efficient and intelligent way to care for your garden. Just open the GARDENA smart App and control your garden maintenance from home or on the go. The smart system automatically provides the optimal care. It takes into account soil moisture measured by the smart Sensor and weather forecast. The watering schedule of the smart Water Control is then automatically adjusted when required. You can even use voice control and connect the smart system with Alexa, Apple HomeKit or Google Home.

More on page 50

Balcony & terrace

You don't necessarily need a huge garden. Outdoor oasis can also be found on balconies and terraces. Whether oleander, laurel or lavender: planters and potted plants can turn your terrace or city balcony into an oasis of well-being. Blooming flower boxes bending towards the sun. Be surrounded by eye-catching and colourful plants and enjoy time with friends in your outdoor oasis. Now you can easily design the outside as charming as the inside and make it beautiful for yourself. Get the water-efficient and absolutely convincing irrigation solution for your balcony or terrace.

Discover our
Starter Sets for Balcony
& Terrace on page 66

Quenching the insatiable thirst

The plants in pots and planters can be divas. Sometimes they complain about waterlogging, they drown in water, they feel dehydrated, or they cry out for water. And other times, the plants bend their neck because they don't receive sufficient water. The Micro-Drip-System is your little helper to ensure accurate and water-efficient watering of your plants. Drop by drop it transports water directly where it is really need: at the root of the plant. Especially due to the scarce amount of soil available, only little water can be stored and regular watering is a must for potted plants. You want to provide just the care right for your plants? Then Micro-Drip-System is the right solution you have been looking for. It cares for your plants with every precious drop. Not only when you are at home but also when you are traveling. Your plants will continue to thrive, even when you are away. Beautiful and healthy plants are the result from precise and accurate watering at the root of the plant. You don't know where to start? With the help of the Starter Sets, the Micro-Drip-System is easy to install. Every step is easy to follow, even if you're not technically minded or struggle with your green thumb. With AquaBloom you don't even need a power supply, because the device is solar powered and can water up to twenty plants. From now on you can relax and your plants are well looked after.

More time to relax.

The Micro-Drip-System takes care of the irrigation.

Maybe you have to get used to it first: to the free time. The Micro-Drip-System is always there to reliably and conveniently care and water your geraniums, verbenas, petunias, herbs and other plants in your outdoor space. After all, the growing season lasts from spring to autumn and the system will support you throughout that time period. The Micro-Drip-System: your reliable and water-efficient helper for a blossoming outdoor space.

Drip Heads are the best technique to water plotted plants and planters. Endline Drip Heads are ideal for watering stand-alone plants in individual pots. Inline Drippers are best suited for flower boxes and pots with several plants. Easily create your individual solution or check out our range of starter sets for your individual watering needs.

For balconies and terraces, the 4.6 mm Supply Pipe and Connectors are most suitable. You can easily hide the installation behind the pots and planters for it become nearly invisible.

Feature of Dripper

Ideal amount of water

Either constant or adjustable water output.

Reliable water volumes

Consistent water delivery over the entire system. Thanks to pressure compensating Drip Heads. Even with differences in height between the pots, it is guaranteed that all plants are watered evenly.

No clogging

Labyrinth technology in the Drip Heads prevents deposits. The system cleans itself.

Auto Stop

Saves water because the the Drip Heads closes itself when it is switched off and does not drip.

Easily cut the pipe and combine it with other components.

Screw the Endline Dripper onto the end of the pipe.

Inline Dripper are mounted into the ends of two pipes.

Tip

The Installation tool helps you to easily screw the Endline Dripper onto the end of the pipe.

56

Irrigation miracle without the need of water tap

With the autonomous irrigation solutions from GARDENA, watering your plants on the balcony or terrace is going to be a breeze. You don't have a water tap on your balcony or terrace? Or you don't want to be connect to the main water supply?

You don't have access to a water tap or power?
GARDENA AquaBloom

Is there no water tap and power socket on your balcony or terrace? Then the solar-powered AquaBloom is the perfect solution for you. It supplies plants and flowers with water without the need to have access to a socket or water tap. AquaBloom can water up to 20 plants and transform your balcony or terrace a blooming oasis.

- No water connection necessary.
- No electricity connection needed.
- Solar powered.
- 3-in-1 control unit (pump, watering control, solar panel).
- 14 pre-defined watering programmes.
- As set available: 10.5 l sustainable, expandable water reservoir.

Further benefits of AquaBloom

Battery and solar-powered control

You don't need a power socket. Simply insert the supplied batteries and you are ready to go.

Set watering frequency

You can set the desired watering frequency by simply turning the orange control knob. From 10 minutes every 12 hours to 20 minutes every 72 hours. The choice is yours.

Effortlessly irrigation

AquaBloom transports the water to your plants, even if the water tank is on another floor.

Easy to install

Combine AquaBloom with the Micro-Drip-System on balconies and terraces. Simply connect the supply pipe to the AquaBloom, select the desired schedule and the supply of water starts. The water from the water tank is pumped to each Dripper, watering the root of the plant.

You have a power connection? GARDENA Balcony Watering

The GARDENA Fully Automatic Flower Box Irrigation automatically irrigates up to 25 plants. No water tap is required. This autonomous irrigation solution can pump water even from sustainable water reservoir, such as rainwater tanks. It is also suitable for watering potted plants. The water flow is controlled by the computer and is automatically switched on and off. This is convenient and gives you more free time to relax. The integrated 14 watering programmes allows you to provide and selection the optimal care for your individual plants. The set requires everything you needs, including a pump. Now you are ready to go in no time.

- The water is pumped out of the container with the pump.
- With the watering control for the pump you can choose from 14 watering programmes.
- Inline Dripper deliver water to the plants in a dosed and water-saving manner.

Tip

Indoor / holiday watering

Suitable for outdoor and also indoor plants. You can easily water your plants, even when you are not at home. GARDENA offers a clever, automatic watering solutions for up to 36 indoor plants. You don't require access to a water tap. The pump activates the watering schedule for one minute every day. The distributors supply drop by drop the roots of the plants with water. The full set includes pump, pipes, water reservoir, various irrigation drip distributors and transformer with integrated timer. Everything you need to start watering your plants immediately. The low-voltage transformer ensures safe and flexible use.

Starter-Sets for your
vegetable and ornamental
garden and raised beds
on page 67

Irrigating plant areas

The majority of vegetables mostly consist of up to 90 % water, from broccoli to tomatoes and the top seller, cucumber. To thrive, the plants need plenty of water. Especially in hot summer months, such as July and August. Consistent and precise irrigation is also crucial for newly planted plants. Because of their shallow roots, young crops need care and gentle watering if they are to thrive. A useful and practical alternative to a watering can or garden hose is drip irrigation, which transports water directly where it is needed: at the root of the plant. Micro-Drip-System is the most efficient way to water your plants. Other parts of the plant stay dry which is especially important for the leaves. This means no unnecessary watering, no lost water and a water-efficient irrigation solution. As part of the Micro-Drip-System you can also select from range of Spray Nozzles and Sprinklers that provide the optimal care for your plants and vegetables. Easily create your own individual irrigation solution: From irrigating smaller to large sections. GARDENA offers a range of Spray Nozzle with various spray radius, from 90 to 360 degrees. Finally a system that cares for your plants and supports richer harvest.

Best irrigation for your bed? It's here!

Micro-Drip-System for plant areas

Vegetable beds and flower borders

Summers are getting hotter and drier. Water-efficient irrigation is therefore fundamental. Use Spray Nozzles as a reliable and accurate irrigation solution for your plants. Decide how to use the little irrigation helpers most effectively. There are so many options, simply choose based on the watering requirements of your plants. Thanks to the Quick & Easy connectors, you can reach every corner in the bed and the system grows with you, so to speak.

For example, if your vegetables are positioned in a row, you install the Endline Micro Strip Sprinkler or Micro Strip Sprinkler.

If you want to water your plants from a corner, select the 90° Spray Nozzle. Alternatively, you can position a 360° Spray Nozzle in the middle of the bed to irrigate all the surrounding plants. There is also the ingenious 6-in-1 Spray Nozzle with six different spray patterns and volume regulation. With the fine Micro Mist Nozzle the water is finely atomised from above. This is a boon for sensitive seedlings.

Endline Micro Strip Sprinkler
Irrigation of long narrow vegetable and flower beds in one direction.

Micro Strip Sprinkler
Irrigation of long narrow vegetable and flower beds in both either direction.

Spray Nozzle 90°
Irrigation of vegetable and flower beds from the corner.

Spray Nozzle 180°
Irrigation of vegetable and flower beds with 180° spray jet.

Spray Nozzle 360°
Irrigation of vegetable and flower beds in the centre of the bed.

6-in-1 Spray Nozzle
Can be used for all areas. Rotating head allows direct spray range spray-wide regulation.

Micro Mist Nozzle
Irrigation from above. Ideal for watering of plants or seedlings in the greenhouse.

Loving plants. Easy installation.

The system grows with your plants. With the Extension Pipes, the Spray Nozzles grow upwards with your plants. You can regulate the flow and the range and adapt flexibly to the required situation.

DIY instruction

56

Hedges & Shrubs

Anyone who has ever experienced the benefits of an irrigation installation in plant hedge and rows will not turn back. On the one hand your plants, such as hedges, shrubs or small row of plants, benefit from it. On the other hand, you feel better as you have less gardening chores. From now on, your Micro-Drip-System takes over all watering chores, while you relax in your favourite chair. Your plants get exactly what they need: the exact amount of water to thrive. The drip irrigation system supplies your plants with the hydration they need sustainability and precisely. Due to the slow release, the water seeps into the soil.

starter-sets for
your plant rows
on page 67

Watering plant rows

You don't have to be brave. Just motivate yourself to try this way of irrigation. You will be amazed! Simply take the drip irrigation line in your hand, run it along your hedges and shrubs and the irrigation of your garden is in safe hands. The Dripline has integrated drippers which are positioned at 30 cm distance. Ideal for efficient and accurate watering of row of plants. Practically no great effort is required - you simply install and start using the system. Your plants are being well taken care of, while you can do what you enjoy doing. By the way, you can choose to use above-ground or below a invisible ground installation.

The direct link to the root

Watering intelligently with a dripline.

It is important to keep the root balls moist immediately after planting. And these "green walls" still need water later on. Decide whether you want to lay the drip line above or below ground; both options work. The Micro-Drip-System provides continuous, regulated and efficient water supply. Plants thrive especially well in rows of plants, such as hedges, bushes and shrubs. The integrated drippers supply water to the plants directly "in line" along the roots.

Dripline for vegetable- and small plant rows

Above ground installation

- Maximum pipe length: 30 m (Master Unit placed centrally in the pipe run)
- Branches and extensions at any time possible with Easy & Flexible connectors

Installation-
video

Dripline for hedges and border plantings with even spacing

Above and below ground installation

- Maximum pipe length 140 m (Master Unit placed centrally in the pipe run)
- Branches and extensions are possible at any time with Quick & Easy Connectors
- Constant water output even with differences in height
- Invisible underground installation thanks to the root protection

Installation-
video

Hedges and border plantings with uneven spacing

Above ground installation

You can turn the Endline Dripper in irregular intervals directly into the Dripline in order to water directly at the plant. You can find an overview of the Endline Dripper on page 21.

66

Did you know that you can use rainwater sustainably?

We consume around 140 litres of drinking water per capita every day. Are there ecological alternatives? Of course there are! Collect rainwater and use it! It makes sense to save the valuable resource of water and use rainwater for watering the garden, since it falls from the sky for free anyway. If you use rainwater, you make an active contribution to environmental protection and save money. In addition rainwater is naturally free of lime and chlorine and has the right temperature. This is good for your plants. So become a rainmaker, fetch the collected rainwater from a rain barrel, well or cistern, pump the water with the help of your chosen pump and water your garden with a clear conscience.

You can find our pump range at
www.gardena.com

Lawn

Regular immersion in a green oasis can be healing. Perhaps that is why the lawn is one of the areas that most people consider the most important part of a beautiful garden. Lush and green, soft and dense. The lawn makes you feel good, especially when you look outside into the garden. It makes you even enjoy to spend more time outside while breathing in the scent of the fresh grass. What is the magic formula for a well-kept lawn? The most important fertiliser for the lawn is water. That's why watering is important in every part of your garden. How do you implement this in every day life? It is simple. Just install an irrigation systems that enables to you supply water to every corner of your garden. It is the first step into an automated underground irrigation solution. Once installed, you can easily irrigate your lawn with the support of the GARDENA Sprinklersystem. Flexible, convenient and efficient. We tell you how to achieve this.

The Sprinklersystem that understands your lawn

Finally a beautiful lawn! GARDENA is at your side when it comes to understanding your lawn. Because when the intelligent Sprinklersystem takes over the irrigation, your lawn reliably gets as much water as it needs. You don't have to think about it and you don't have to water any longer by yourself. With an automatic Sprinklersystem, you are investing in sustainable lawn care solution. After just a few simple steps, the lawn irrigation system is installed and even in increasingly dry summers, your lawn is reliably cared for. The invisible and unobtrusive Sprinklers disappear back into the ground once they have completed their irrigation task. Installed with an irrigation control your system works fully automatic. This way your lawn is efficiently watered. Explore our wide range of Pop-up Sprinklers for small and large, round, square or complex lawns. Simply adapt your choice to the shape of your lawn. And if you're considering to install a new lawn, it's best to be smart and consider automatic irrigation when planning your garden.

Convenient and reliable lawn irrigation

Sprinklersystem

Still watering your garden with a hose? The trend is shifting - also for sustainable reasons - towards automatic underground irrigation. When it's time to water, the water flow pushes the Pop-up Sprinklers out of the ground and they disappear again once pre-defined watering schedule has been completed. The watering schedules are based on the shape of the lawn and its water requirements. Based on your pre-defined watering schedule, the Pop-up Sprinklers supplies your lawn with water exactly at the frequency and duration as it requires. This gives the soil enough time to absorb the water without running off unused on the surface or seeping away. That is sustainable lawn irrigation.

1 Irrigation Control & valves

For the automation of the Sprinklersystem and for controlling of different watering zones.

2 Pressure Regulator

The Pressure Regulator with integrated filter prevents pressure peaks and protects against dirt water. This improves the quality of the system.

3 Pipes & Connectors

Simple, durable and watertight thanks to the Quick & Easy technology.

4 Pop-up Sprinklers

A wide range for flexible installation for every garden size.

Tip

The GARDENA myGarden Planner helps you to plan your Sprinklersystem installation based on your requirements of your individual garden. Recreate the layout of your garden by using the automatic planning aids. In a few simple steps you have everything you need to install the ideal Sprinklersystem installation for your garden. Also check the DIY section in this brochure for more detailed information.

Automatic irrigation - exactly the way you need it.

Choose ideal Water Control for you and your garden.

The summers are getting hotter and drier, your garden is getting thirstier. And it wants to be watered, even when you don't have time or are on holiday. Choose from range of solution that makes most sense for you and your garden. From manual to fully automatic, everything is possible.

With power connection

Classic Irrigation Control

It's simple and flexible. With a multi-channel control, you can use the display to programme a schedule to water your lawn. By opening and closing the valves, the watering cycles are then executed automatically and reliably.

Classic Irrigation Control with Sensor

Optionally combine a Soil Moisture Sensor with your Sprinklersystem. This has the advantage Sensor continuously monitors the moisture level of the soil. If the soil is sufficiently moist, after an extensive rainfall, a pre-defined watering schedule is automatically skipped. This allows you to water cleverly and efficiently, even when you are not at home.

smart multi-channel Irrigation Control with smart Sensor

This control allows for six valves to be individually programmed and irrigate up to six garden areas as needed. You can operate the smart Irrigation Control via the GARDENA smart App and set up a suitable watering schedule for each individual watering zone. Weekdays and duration of the watering cycles can be selected individually. Via the smart GARDENA App you can access the Sprinklersystem at any time and from anywhere. Together with the smart Sensor and weather forecast the watering schedules are automatically adjusted and you save even more water while your garden is thriving.

Without power connection

Regulator and Shut-off Valve

With this you can regulate the water flow of individual Pop-up Sprinklers or groups of Pop-up Sprinklers simply by opening and closing them manually.

Irrigation Valves 9 V Bluetooth®

Even without a power connection, you can automate the watering with the help of the Bluetooth® control. The control unit is simply mounted on the valves. The valves open and close automatically according to a schedule.

Irrigation Valves 9 V Bluetooth® with Sensor

The system becomes even more professional with the help of Soil Moisture Sensors. These are connected to the Bluetooth® control unit via a cable. If the soil is sufficiently moist, planned watering cycles are automatically skipped. This helps to save water.

The Sprinklers at a glance

Our new Pop-up Sprinklers are made of high quality materials and ensure an even more reliable and watering.

Small-sized lawns

Pop-up Sprinklers SD range

SD Pop-up Sprinklers are designed for small and narrow lawn areas. Thanks to the wide range of the spray sector, you can also use the sprinklers particularly well in corner areas. The Pop-up Sprinkler can be flexibly adjusted without tools from 5-360°, depending on the conditions on site. The spray distance can also be adjusted by a screwdriver to the size of the area. The integrated filter protects the nozzle from dirt.

Medium-sized lawns

Pop-up Sprinklers MD range

The Pop-up Sprinklers from the MD models are circular sprinklers for medium-sized lawn areas, which convince with new, consumer-friendly functions and can be combined with T-sprinklers, as well as the OS 140 within one zone. A highlight is also the water-efficient Rotary nozzle. With its rotating spray pattern and its low wind sensitivity and dosed precipitation, it is easier for the plants to absorb the water well. The sprinkler distributes the water evenly, regardless of spray distance and sector setting.

Large-sized lawns

Turbo-driven Pop-up Sprinkler T380

With the GARDENA T-irrigation models you can water large lawns comfortably. Thanks to a similarly low water flow rate, you can combine them with the MD Sprinklers and the OS 140.

Square or rectangular areas

Pop-up Oscillating Sprinkler OS 140

Square or rectangular areas between 2 and 140 m² can be watered simply and conveniently. Where previously several circular sprinklers and pipes were used, now one sprinkler is enough for lawns up to 140 m². The Pop-up Sprinkler OS 140 is also suitable for particularly small and narrow areas. Uniform watering: 16 flexible precision nozzles made from soft plastic ensure particularly even water distribution and reliable operation.

High plants

Pop-up Sprinkler MD40/300

The MD40/300 Pop-up Sprinkler has a 30 cm long sprinkler body which allows watering even over taller plants. It is equipped with a rotating nozzle that distributes the water with gentle, water with gentle rotating jets and, if desired, can water the lawn and plants at the same time.

New!

Pressure regulation and water filtration

Pressure Regulator

Research and development ensure that GARDENA products are constantly being further developed. For example, the combination of pressure regulation and water filtration improves the service life of the Sprinklersystem. The pressure is regulated to a maximum of 3.1 bar. The Pressure Regulator protects the Sprinklersystem from too high water pressure and can be combined with the underground Pipeline and Connectors. This prevents damage and prolongs the life of the system. In addition, the integrated filter protects against dirt.

New!

Underground water network

It is a fact that plants need water. No matter where they are located in the garden. Either you use a watering can or the water is automatically transported to every corner in your garden. How does it work? The answer is Pipeline. An underground water network with endless possibilities to provide the right care for you and your plants. This irrigation system is straightforward to install and suitable for gardens of any size. Pipeline connects even remote areas of your garden with the water supply. With just one click you can tie in a range of devices to this life-changing GARDENA Irrigation System. From Water Tap to Micro-Drip-System, the choice is yours. Unlock the secret of sustainable and versatile watering for you and your garden. Just select the location, install a water socket and watering any area in your garden will become a breeze.

Connected to water supply

Using a garden hose or watering can are the traditional way of watering your garden. Modern technology has transformed the world of garden irrigation. Thanks to Pipeline, even remote areas of your garden will receive just the right care for them to blossom to their fullest potential. Without tugging or rolling up a hose or dragging water. Pipeline is basically a more sophisticated and versatile concept of a garden hose system. It is installed underground and connects all areas of your garden to an invisible network of pipes and Water Stations that ensure continuous water supply. Hidden and convenient. Just decide on the location, install a Water Station and create a convenient water source anywhere in your garden. They are called Water Stations as you can connect a range of devices to it and withdraw water like electricity from a socket. From garden hose to automatic irrigation solutions, such as Micro-Drip-System. Each Water Station is equipped with an automatic stop valve, so there is no need to go to the water tap and no water is wasted when disconnecting the hose. Thanks to Pipeline underground network system, water supply is guaranteed which will put you in a happy mood.

Unlimited possibilities with the Pipeline

Get out of old habits. You can keep everything as it is or optimize the irrigation of your garden. In this case optimising means using water sensibly while also giving yourself some relief. Discover the world of Pipeline and the benefits of an underground installed water network that transports water to even remote areas of your garden. We guide you through a Pipeline optimised garden. You will realise that Pipeline is a must-have irrigation helper ideal for any garden.

Convenient, reliable and easy to install

Pipeline is straightforward to install and can easily be configured to your individual garden. Just cut the pipes to the required lengths and build your own underground network. Quick & Easy technology allows easy connection of pipes with connectors. Just push the pipes on either end of the connector and twist the grey part to lock the pipes in place. Just as simple as that.

Frost protection

Use the Drain Valve at the lowest position in the system to make the complete installation frost-proof.

Water Station and Hose Box

Wherever the hose box is placed in the garden, with Pipeline you have always the suitable connection to the water supply.

3

Water Station

Water Station with Original GARDENA System. Flexible connecting options for all OGS applications.

4

Water Station and Micro-Drip-System

With the Pipeline system water can be supplied to the Micro-Drip-System.

1

Connecting Point

The water inlet to the system. Connected to the water tap with GARDENA Profi System for maximum water flow.

7

Water Station & Pipeline Garden Water Tap

The Pipeline Garden Water Tap provides for convenient access to water.

6

Water Plug

The GARDENA Water Plug provides for easy tapping without the classic water tap. The Water Plug can be attached to the wall or in loose subsoil with spike.

5

Water Station and Pipeline Oscillating Sprinkler

Watering made easy by attaching the Pipeline Oscillating Sprinkler onto the Water Station for watering the desired area.

Pipeline and Sprinklersystem

Using the valve box or the control- and shut-off valve the Sprinklersystem can be connected to the underground Pipeline.

Automatic water control

It's quite time-consuming to meet the water requirements of each individual plant in your garden. When it comes to watering, it does not only depend on the right amount of water, but also on providing it to the plants at the right time and at the correct intervals. The automatic Water Control does just that. This makes plant irrigation even more efficient. Your potted plant needs water daily, the vegetables once a week, and the flat-rooted shrubs grow best when they are watered vigorously once every three days in the early morning. As a gardener, you can sometimes get stressed, because your garden needs water even when you are away or simply still asleep. The clever solution is automatic Water Control.

Why are automatic Water Controls so vital?

Because the best time to water your plants is early in the morning. But you might still be in bed sleeping. Early mornings the soil absorbs the water particularly well. The nutrients easily dissolve around the roots and the plants can re-charge their batteries for the day. The results are healthy plant growth and rich harvest. With the Water Control, you will never forget to water again and save yourself the effort of getting up early. It relieves you from gardening chores and you have more time to relax. Water Control can also even stand in while you are on holiday. Due to the clearly defined watering schedules, you save not just water, but also time.

How would you like to irrigate?

Above-ground irrigation - from the tap
For watering of max two garden areas.

Everything is straightforward and flexible: install the Water Control directly at the tap and your plants will be automatically well taken care of. The GARDENA Water Control can easily be set up to water your plants in the mornings or when you are out and about. Just select the frequency and duration of the watering cycle and the Water Control takes charge of your gardens' well-being. Discover our range of Water Controls and find the right model for your needs.

More on page 44

Below-ground irrigation
For watering of several garden areas or for fully automated lawn irrigation.

Multi-channel Irrigation Control is ideal when the amount of water from the tap is not sufficient to operate the complete irrigation system at the same time or when different areas in the garden have individual watering needs. Use it to water the lawn, the hedges or the flower beds independently of each other. With the multi-channel Irrigation Control you can set watering schedules and provide just the right care for each individual area.

More on page 48

The ideal model for your needs

GARDENA offers a variety of water controls that are easy to use and reliable. From digital devices to App-controlled water controls, find the suitable product for every different application needs.

Digital Water Controls

Benefits

- Operating panel can be removed for easy programming
- Easy adjustment thanks to an intuitive push and turn principle
- Can be used in combination with a Soil Moisture Sensor

Water Control Bluetooth®

Benefits

- Easy configuration via GARDENA Bluetooth® App from up to 10 m distance
- Easy set up with step-by-step instructions
- Can be used in combination with Soil Moisture Sensor

smart Water Control

Benefits

- Easy configuration via GARDENA smart App from anywhere
- Auto Schedule develops the ideal irrigation schedule automatically
- smart home: operation via voice control with Alexa, Apple HomeKit or Google Home

Special features

High quality

Weather-proof electronics and corrosion-resistant valve. Pressure-resistant from 0.5 to 12 bar.

Water-saving

Usage with Soil Moisture Sensor automatically skips predefined watering schedule when soil is already sufficiently moist.

Safe Stop

The unique technology prevents watering when the battery is low.

Manual Watering

The central button allows you to start manual watering with automatic stop function.

At the root of the plant

Soil Moisture Sensors

Watering your garden has never been so easy and accurate: The innovative Soil Moisture Sensors from GARDENA automatically ensure that your garden is watered as needed and in a water-saving manner by measuring the real-time soil moisture and sending this data to your Water Control. If the soil is sufficiently moist, the pre-defined watering schedule is skipped. As a result, your plants automatically receive reliable and accurate care, while you save water.

Used in combination with analog
or Bluetooth® Water Controls

Soil Moisture Sensor

Benefits

- Skips the next watering schedule if soil is sufficiently moist
- Flexible set up of the moisture levels limits for Flex, Select, Master & Bluetooth Water Controls
- Connection with Water Computer can be extended with Extension Cable (art.no. 1868-20)

Operated via GARDENA
smart App

smart Sensor

Benefits

- Measures the soil moisture and sends a signal to the smart Water Control to skip the watering schedule when required
- Measures temperature
- Flexible setting of moisture level
- History of measured soil moisture data can be tracked on the app

Special features

Extra flat head

The smart Sensor has a modern design with a flat head. It can easily be placed in the lawn. The robotic lawnmower will drive over it and continue mowing.

Versatile

The sensors can be used in combination with a multi-channel Irrigation Control or Bluetooth® Irrigation Valve.

GARDENA Irrigation Control

Above-ground Water Controls

Flex

Balcony & terrace / micro irrigation

Use

- For watering potted plants/balcony plants
- Flexible setting with short cycles and high watering frequencies (up to every 4 hours)
- Ideal in combination with the GARDENA Micro-Drip-System

Watering schedules	1
Start time	flexible
Duration	1 sec. - 99 min.
Intervals	every 4/6/8/12/24/48/72 hours
Selection of weekdays	predefined cycles
Watering cycles/day	up to 6 (every 4 hours)
Water-saving option	• with Soil Moisture Sensor
Manual watering	•
Art.-No.	1890

Select

3 watering schedules / all garden areas

Use

- For convenient, flexible watering
- 3 individual watering schedules including start time, duration, week days - ideal e.g. for pre-watering the soil
- Ideal in combination with Sprinklers or Micro-Drip-System

Watering schedules	3
Start time	flexible based on schedule
Duration	1 sec - 7 hrs 59 min per schedule
Intervals	weekdays per schedule
Selection of weekdays	• per schedule
Watering cycles/day	up to 3
Water-saving option	• with Soil Moisture Sensor
Manual watering	•
Art.-No.	1891

MultiControl duo

Up to 2 areas

Use

- For independent watering of 2 areas
- For instance the lawn behind the house and the flower beds in front of it

Watering schedules	2 x 1
Start time	flexible based on schedule
Duration	1 sec - 3 hrs 59 min per outlet
Intervals	selection of weekly programs or in cycles every 8/12/24 hrs every 2nd/3rd/7th day
Selection of weekdays	• for each schedule
Watering cycles/day	up to 3 (every 8 hours)
Water-saving option	• with Soil Moisture Sensor
Manual watering	•
Art.-No.	1874

Master

6 watering schedule / very flexible settings / up to 6 areas

Use

- For automatic watering of a large area in the garden with a maximum of flexibility in time
- 6 individual watering schedules including start time, duration, week days
- Watering of up to 6 different areas in combination with the ● Water Distributor automatic.

Watering schedules	6
Start time	flexible based on schedule
Duration	1 sec - 4 hrs per schedule
Intervals	weekdays
Selection of weekdays	• for each schedule
Watering cycles/day	up to 6
Water-saving option	• with Soil Moisture Sensor
Manual watering	•
Art.-No.	1892

App based watering controls

Bluetooth®

Via GARDENA Bluetooth® App / all garden areas

- Use**
- For convenient, flexible watering per Bluetooth® App
 - Up to three individual watering schedules
 - Ideal in combination with Sprinklers or Micro-Drip-System

Benefits of the Bluetooth® App:

Watering schedules	3
Start time	flexible per schedule
Duration	1 min - 8 hrs per schedule
Intervals	weekdays per schedule
Selection of weekdays	• for each schedule
Watering cycles/day	up to 3
Water-saving option	• the Soil Moisture Sensor
Manual watering	•
Art.-No.	1889

smart Water Control

Control via GARDENA smart app

smart Water Control
With the smart Water Control you can flexibly set the watering schedules in the GARDENA smart App and adjust them as needed at any time.

Benefits of the smart App:

Watering schedules	free selectable
Start time	flexible per schedule
Duration	1 sec - 10 hrs
Intervals	weekdays
Selection of weekdays	• per schedule
Watering cycles/day	individual
Water-saving option	• with smart Sensor
Manual watering	•
Art.-No.	19031 or supplied with smart system sets

More information on the GARDENA smart System on page 50.

Add-ons for analog or app-based watering controls

Soil Moisture Sensor
Measures and skips scheduled watering cycles as soon as a pre-set moisture level is reached. For optimized, water-conserving watering in connection with a GARDENA Water Control.

Art.-No.	1867
----------	------

smart Sensor
Measures the soil moisture level and the ground temperature and transfers those data to the GARDENA smart App. Can be used in combination with the smart multi-channel Irrigation Control and the smart Home & Garden Pump.

Art.-No.	19040
----------	-------

Water Distributor automatic ●
Perfect in combination with the Water Control Master. With several irrigation lines, e.g. for GARDENA Sprinklers, Micro-Drip-System or Sprinklersystem. Each line can be triggered up to once per day by the Water Control Master. Ideal for planted areas with different watering needs or if the water pressure is too low to water them all at the same time.

Art.-No.	1197
----------	------

Underground water control

Multi-channel control for the versatile gardens

The most common type of automatic watering is lawn irrigation. It is the most straightforward solution, not only for the lawn, but also for other areas of your garden. Dry spells in your garden are going to be a thing of the past. Whether you want to irrigate your lawn, flowerbeds, potted plants, shrubs or hedges, your automatic watering system will take care of it. The multi-channel Control is ideal when the water supply of the tap is not sufficient to cover the entire garden at once. It also lets you irrigate different areas of the garden individually. Define a watering schedule for each zone, incl. time and frequency. Sit back and relax.

Visit www.gardena.com/mygarden
to plan your watering system with
our my Garden Planner

Possible applications of the multi-channel control

Lawn/Sprinklersystem

The multi-channel Control is ideal to be used in combination with a Sprinklersystem. The lawn can be divided in different areas with individual watering schedules.

Watering several garden areas

For watering different areas in the garden the Micro-Drip-System can be connected to the Valve Box using a Water Station.

smart watering doesn't only mean more free time, but also reduced water consumption.

If you want to integrate automatic irrigation into your garden, the first step is planning. Ask yourself questions like: What do I want to irrigate? Which components are needed? Where is the water connection? How large is the area I want to irrigate? Is the available amount of water of the connection sufficient to irrigate all areas simultaneously? Or is it necessary to water only one area? You think this is too complex? It only seems so. With our Sprinklersystem Planner Tool you learn more about the topic and it supports you in the planning process. The GARDENA smart multi-channel Irrigation Control is the „control center“. It can be operated manually, automatically with a defined watering schedule or in combination with smart Sensor. In the smart App, the schedule can be activated with sunrise sunset automation. With the smart system your entire garden is irrigated at an optimum level and sustainable manner as it collects, analyses and aligns data from soil moisture data, weather forecast reports and auto schedule settings.

More on page 50.

Utilise all options

It can be so simple: You redesign your garden. You start from scratch and install a multi-channel solution right now. In doing so, you set the foundation that will later benefit your garden, relieve you from chores and reduce water consumption. It lets you define the ideal irrigation solution for the entire garden. Whether you start to use them now or later. The Water Control can be used individually and as part of a system if desired.

With power supply

How to centrally control the irrigation of your entire garden: Via the GARDENA Multi-Channel Control **1**, the 24V irrigation valves **2** in the valve box **3** receive through a cable **4** the signal to open or shut-off the water flow. This way, up to 6 irrigation valves and the corresponding number of channels can be activated fully automatically. Your garden can be watered in the different areas according to their individual needs. Also, you have the option to connect a Soil Moisture Sensor. **5**

No power supply exists

How to control any number of watering channels via app, fully automatically and cordless with the GARDENA Bluetooth® App **1**. Simply program the data and transmit them to the irrigation valve via app. The Irrigation Valve 9 V Bluetooth **2** fits in a GARDENA Valve Box **3**. You have the option to connect a soil moisture sensor **4** to the control unit. Operating the system via battery makes the GARDENA Irrigation Valves independent from power supply. The valve boxes can be installed at any place in the garden.

Special features

EasyApp Control

Auto Schedule

EasyConfig

Bluetooth®
Connection

smart system

How to make your garden smart? If you like, quick and simple. Lawn irrigation is often the starting point for automated solutions, after which other areas can follow, e.g. drip irrigation for a flower bed. Smart is that you can water automatically and as needed, from anywhere and any time. Also you are easily able to integrate a smart robotic mower, pump or the smart adapter plug into your smart system. Coordinate watering and mowing times. You are on the road? No problem. You are always connected to your smart garden and in the picture at all times. You alone decide how and with what you enter into your personal smart system or whether and with which solutions you expand it.

Connect. Control. Thrive.

The GARDENA smart system is the intelligent system that converts your garden into a smart garden. Now you can complete daily gardening chores the smart way via the GARDENA smart App. Adjust and connect individual tasks or even automatise recurring chores. As a result you can save time and achieve a well-kept and thriving harvest while saving up to 70 % water. Via the smart App you can water one or several areas in your garden with bespoke settings or operate the robotic lawnmower. You can transform your garden into a relaxing, sustainable and comfortable space of well-being in no time at all. With the support of the GARDENA smart system, you have all the features at your fingertips.

smart lawn care

Mow the lawn automatically the smart way. With the GARDENA smart App, you can control your **smart SILENO Robotic Lawnmower** to achieve a carpet-like cut for all lawn sizes up to 1,500 m².

smart lawn irrigation

Effortlessly water multiple areas of your garden with an underground irrigation system. The **smart Irrigation Control** manages up to six irrigation valves – each of which can be independently controlled via the GARDENA smart App.

smart plant irrigation

Water a single garden area with tap water. The **smart Water Control** lets you remotely control your garden taps for perfect results – simply controlled via the GARDENA smart App.

smart and efficient irrigation

Measure the soil moisture and temperature in your garden or in planters and check it in the GARDENA smart App. Using the **smart Sensor** with a smart Water Control, a smart Irrigation Control or a smart Pump, you can save water and ensure the right level of watering.

smart and sustainable irrigation

Use rainwater or groundwater for irrigation and domestic water supply with the **smart Automatic Home & Garden Pump**. Controlled via the GARDENA smart App, you can water your garden based on pre-set schedules, or even provide water to your toilet and washing machine.

smart control of electrical devices

Plug any electrical device into the GARDENA **smart Power Adapter**, e.g. your lights or fountain pumps and switch them on or off whenever you want, wherever you are via the GARDENA smart App. Keep your garden looking smart day and night.

Easy access to your networked garden

You want to keep track of the gardening chores at any time? You want to amend the maintenance setting even when you are out and about? The GARDENA smart system gives you the control you want and your garden the attention it needs.

The GARDENA smart range is an interconnected system with smart gardening devices that communicate with each other and the GARDENA smart App to provide just the right care for your garden. No matter where you are. Just open the app, connect to your smart garden and control each individual smart gardening device for a thriving and blossoming garden.

GARDENA smart App

Download and connect to the free GARDENA smart App on your smart phone and access your entire garden at the touch of a button. Mowing the lawn and watering your plants has never been so easy and convenient. Even lights or other electrical devices can now be switch on and off with just one click.

smart Gateway

The smart gateway communicates with each GARDENA smart gardening device using powerful smart radio technology. The smart Gateway is connected to the router at home via LAN cable or WLAN.

Micro-Drip-System for Potted Plants

Starter Sets

MADE IN GERMANY

New! Set

Micro-Drip-Irrigation Balcony Set For 15 plants

Contents: 1 Master Unit 1000, 20 m Supply Pipe 4.6 mm (3/16"), 10 Pipe Pegs 4.6 mm (3/16"), 15 Inline Drip Heads pressure-compensating 2 l/h, 5 T-Joints 4.6 mm (3/16"), 2 Regulation and Shut-Off Valves 4.6 mm (3/16"), 5 Plug 4.6 mm (3/16")

Artikel No. 13401

New! Set

Micro-Drip-Irrigation Terrace Set For 30 plants

Contents: 1 Master Unit 1000, 15 m Connecting Pipe Flex 13 mm (1/2"), 10 Connectors 13 mm (1/2") - 4.6 mm (3/16"), 2 Plugs 13 mm (1/2"), 20 m Supply Pipe 4.6 mm (3/16"), 20 Pipe Pegs 4.6 mm (3/16"), 5 Plugs 4.6 mm (3/16"), 5 T-Joints 4.6 mm (3/16"), 3 Regulation and Shut-Off Valves 4.6 mm (3/16"), 10 Adjustable Endline Drip Heads 0-15 l/h, 20 Inline Drip Heads 2 l/h, 1 Cleaning Needle

13400

Endline Dripper

1 MADE IN GERMANY

2 MADE IN EUROPE

New!

Endline Drip Head 2 l/h ¹

Water flow 2 l/h

Special features

Contents: 25 Endline Drip Heads, 1 Cleaning Needle

Article No. 13307

New!

Endline Drip Head 2 l/h, pressure-compensating ²

Constant 2 l/h independent of the water pressure

Self-cleaning with membrane/labyrinth technology, constant water output, self-sealing when system switched off

10 pieces

13302

New!

Adjustable Endline Drip Head 0-15 l/h ¹

Adjustable from 0-15 l/h

Fully adjustable endline drip head with integrated cleaning needle

10 pieces

13305

New!

Adjustable Endline Drip Head pressure-compensating ²

Adjustable from 1-8 l/h, independent of the water pressure

Adjustable with volume scale, self-cleaning with membrane/labyrinth technology, constant water output, self-sealing when system switched off

5 pieces

13304

Inline Dripper

For Potted Plants

For Plant Areas

1 MADE IN GERMANY

2 MADE IN EUROPE

New!

Inline Drip Head 2 l/h ¹

Water flow 2 l/h

Special features: Can also be used as Endline Drip Head

Contents: 10 Inline Drip Heads, 1 Plug, 1 Cleaning Needle

Article No. 13317

New!

Inline Drip Head 2 l/h pressure-compensating ²

2 l/h

Self-cleaning with membrane/labyrinth technology, constant water flow, self-sealing when system switched off

10 Inline Drip Heads, 1 Plug

13312

New!

Adjustable Inline Drip Head 0-15 l/h ¹

0-15 l/h

Fully adjustable spray head with integrated cleaning needle

10 Inline Drip Heads, 1 Plug

13315

New!

Adjustable Inline Drip Head ¹ pressure-compensating

1-8 l/h

Adjustable, with volume scale. Self-cleaning with membrane/labyrinth technology, constant water output, self-sealing when system switched off

5 Inline Drip Heads, 1 Plug

DO it YOURSELF

Micro-Drip-System

Tip

For even more convenient and time-saving irrigation, we recommend the Water Control Flex (art. no. 1890) or Select (art. no. 1891). Would you like even more comfort - or control the watering via app? Compare our Water Controls on page 46.

Starter Sets for Potted Plants

Up to 15 Potted Plants

Starter Set Balcony (Art. No. 13401)

Up to 30 Terrace Potted Plants on a terrace

Starter Set Terrace (Art. No. 13400)

Installation video
balcony

Installation video
terrace

You want to water
more plants?

Easily complement the Start Sets by buying the following products:

- + Inline/Endline Drip Heads (see page 56)
- + Pipe Pegs (Art. No. 13218, 13208, see page 54)
- + Connectors (see page 55)
- + Additional Pipes (see page 54)

Tip

Use the colour code as a guide in the planning and selection process. The Starter Sets are also colour-coded for easy identification of your required application usage. If your installation requirement is particularly complex, we recommend using the GARDENA Micro-Drip Configurator as a support when planning your installation.

Online
Configurator

Starter Sets for Plant Area

Raised beds and beds with up to 35 sensitive plants
Starter Set (Art. No. 13455)

Installation
video

**You want to water more
than 35 bed plants?**

Simply buy the required
quantities of Drip Heads:
+ Inline Drip Heads (see page 56)
+ Pipe Pegs (Art. No. 13218)
+ Connectors (see page 54)
+ Pipes (see page 54)

Vegetable/plant beds up to 60 m²
Starter Set (Art. No. 13450)

Installation
video

You want to extend your set?

Select from range of Spray Nozzles
for your specific bed:
+ Spray Nozzles (see page 58)
+ Pipe Pegs (Art. No. 13208)
+ Connectors (see page 54)
+ Pipes (see page 54)

Starter Sets for Plant Rows

Hedges and Shrubs up to 25 m
Starter Set (Art. No. 13500)

Installation
video

**You have a longer
plant row?**

Simply buy your desired extension for your Dripline installation:
+ 25 m Dripline 13 mm 1.6 l/h (Art.-No. 13503) (see page 59)
+ 50 m Dripline 13 mm 1.6 l/h (Art.-No. 13504) (see page 59)
+ Pipe Peg (Art.-No. 13208)

Hedges and Shrubs up to 50 m
Starter Set (Art. No. 13501)

**You have a longer
plant row?**

Simply buy your desired extension for your Dripline installation:
+ 25 m Dripline 13 mm 1.6 l/h (Art.-No. 13503) (see page 59)
+ 50 m Dripline 13 mm 1.6 l/h (Art.-No. 13504) (see page 59)
+ Pipe Peg (Art.-No. 13208)

Vegetable and plant rows up to 15 m
Starter Set (Art.-No. 13010)

Installation
video

**You have a longer
plant row?**

Simply buy your desired extension
for your Dripline installation:
+ 15 m Dripline 4.6 mm 1.6 l/h
(Art.-No. 13010) (see page 59)
+ Pipe Pegs (Art.-No. 13218)

Let's get started.

How to build your own Micro-Drip-System

You'll be amazed: assembling your own MDS solution is easier than you think. Just follow a few simple steps and you will quickly have your individual and convenient watering solution.

System Start

At the beginning you set the Water Control and then the so-called Master Unit. The Master Unit regulates the pressure and filters the water.

Connection

There are 2 different connection sizes. 13 mm Pipes and Connectors for larger areas and 4.6 mm Pipes and Connectors for smaller surfaces, such as balconies.

Potted Plants

For pots or flower boxes choose Drip Heads or Starter Sets marked in yellow.

Plant Areas

For beds you select Drip Heads, Spray Nozzles or Starter Sets marked in green.

Plant Rows

Pipeline for above and below ground irrigation of plant rows. Select the practical-Starter Sets marked in purple and extend them with Extension Pipes if desired.

The planning process

Do you want to extend your existing system or would like to cover an area in your garden that goes beyond the components included in the Starter Sets? Would you like to create your bespoke Micro-Drip solution and cover different areas in your garden? We are going to show you how many plants you can water with just one connection attached to the water tab.

1. Select number of water outlets available to cover the designated areas.
2. Then identify the load capacity of your irrigation system - the connection value. This is defined by considering following factors:
 - a.) Mode of installation of the Connection and Supply Pipes
 - b.) Positioning of the Master UnitYou can then compare the connection value of your system with the consumption values of all your planned application devices.

1. Assemble the irrigation equipment

Map out the number of pots or size of areas you want to cover. Define the suitable components based on the type of usage application, such as Drip Heads, Dripline or Spray Nozzles. Check out pages 56-59 and discover the range of components available by usage application.

For example:

Terrace with 4 potted plants and 1 plant tray with 5 plants

- 4 x Adjustable Endline Drip Head 1-8 l/h for 4 plant pots
- 5 x Inline Drip Head pressure-compensating for plant pot with 5 plants in row

Narrow flower bed at the edge of the terrace

- 2 x Endline Micro Strip Sprinkler
- 1 x Micro Strip Sprinkler

2a. Select the ideal installation method of Connection and Supply Pipes

Installation type 1

4.6 mm and 13 mm pipes

To be able to cover more plants, the Supply Pipe 4.6 mm is used in combination with the Connection Pipe 13 mm. The main line is the connection pipe, the small supply pipe transports the water to the plants. Maximum combination is approx. 60 m Connection pipe and approx. 15 m supply pipe.

Installation type 2

4.6 mm pipes

In this installation method only the supply pipe and drip line 4,6 mm is used. It is ideal for small garden beds or balconies. Maximum length is approx. 30 m.*

Installation type 3

13 mm pipes

Only the pipe and drip line 13 mm is used e. g. 13 mm drip line or connection pipe in combination with spray nozzles or endline drip heads. Maximum length is approx. 60 m

* The maximum pipe length is given as a guide only. The value can vary based on the number of connected components

2b. Positioning of the Master Unit

The Master Unit is an important component of the Micro-Drip-System. With this ready-to-connect Master Unit the water pressure is regulated and the water is filtered. If you place the Master Unit centrally in the pipe run, you can easily double the length of the pipe system (see 3. Connection values). If the system starts further away from the tap, then you can bridge the distance with an underground GARDENA pipeline or a garden hose. Like this you prevent loss of water pressure.

Master Unit is placed at the System Start

Master Unit is placed centrally in the pipe run

3. Comparison of consumption value and connection value

Three things you need to know:

- The Master Unit is the starting point and defines the connection value, depending on the model and installation type.
- The connection value defines the capacity available for the maximum installation of Drip Heads, Spray Nozzles and Driplines.
- The connection value of the system must be higher than the consumption value of the installation.

The connection value depends on your selection of pipe combination and positioning of the master unit. You might notice in the below table that the connection value with a 13 mm pipe is higher than with a 4.6 mm pipe.

Now enter how many Drip Heads and Spray Nozzles you are planning to install in your system. If the consumption value is below the connection value, you will have a reliable irrigation system.

Connection values

		Master Unit at the System Start		Master Unit in the middle of the pipe run*	
					
		Master Unit 1000	Master Unit 2000	Master Unit 1000	Master Unit 2000
Installation type 1	Connection value Recommended pipe length**	500 13 mm max. 40 m 4.6 mm max. 15 m	1000 13 mm max. 40 m 4.6 mm max. 15 m	1000 13 mm max. 2 x 30 m 4.6 mm max. 15 m	2000 13 mm max. 2 x 30 m 4.6 mm max. 15 m
Installation type 2	Connection value Recommended pipe length**	50 max. 15 m	50 max. 15 m	100 max. 2 x 15 m	100 max. 2 x 15 m
Installation type 3	Connection value Recommended pipe length**	500 max. 40 m	1000 max. 40 m	1000 max. 2 x 30 m	2000 max. 2 x 30 m

Installation type 1

4.6 mm and 13 mm pipes

Installation type 2

4.6 mm pipes

Installation type 3

13 mm pipes

* If the base unit is positioned centrally in the pipe run, then the connected value of each pipe is halved.

** The maximum pipe length is given as a guide only. The value can vary based on the number of connected components.

This is how you proceed ...

To get the most out of your Micro-Drip-System, we recommend **installation type 1**.

This way you can make the most of your system and maximise its capacity to cover even larger plant areas and support an extension of the system. Depending on your individual needs, the other two types of installation are also a good option.

Your to-do list:

1. Determine required quantities of the suitable components based on the type of usage application (Drip Heads, Dripline or Spray Nozzles).
2. Determine consumption values of the system (number of application devices x consumption value in the table).
3. Add up the total consumption values. If the consumption value of the system is less than the connection value, the system will operate smoothly.

Consumption values

Art. No.	Name	Consumption values of the application devices		
Installation type		M1	M2	M3
13302	Endline Drip Head 2 l/h, pressure-compensating	2	2	5
13304	Adjustable Endline Drip Head 1-8 l/h, pressure-compensating	8	8	20
13305	Adjustable Endline Drip 1-15 l/h*	15	15	38
13306	Small Area Spray Nozzle*	—	—	80

* Flexible adjustable Drip Heads/Nozzles are average values. In individual cases, the value may be higher or lower than stated here, depending on your setting.

** Data per metre of Dripline. If you carry out the installation yourself, we ask for your understanding that we accept no liability and no guarantee for costs and damage that may arise during the implementation of the planning.

4. Assembly - simply put together

The Micro-Drip-System is very easy to put together.
Typical GARDENA.

Original GARDENA OGS system

From the tap to the Master Unit

It starts at the water tap: everything is interconnected, such as Water Control, hose and Master Unit. Easy, leakproof, flexible and safe. For over 50 years we are recognised for safe and innovative product solutions and connections.

Micro-Drip-System

From the Master Unit to the plants

Then the Micro-Drip-System takes over. The Driplines are simply put together with the Connectors (e.g. with 4-Way Coupling or T-Piece).

Easy thanks to Quick & Easy technology.

Screw on the desired
Water Control

Mount hose

② Connect the Master Unit as
part of System Start

EASY &
FLEXIBLE

All Drip Heads, Nozzles
and Sprinklers are either
screwed or pushed into the
pipe. Everything is kept
tight, everything is very
easy to do.

①

The pipe can easily be
cut with scissors

⑥ Install Inline Drip Heads
for plant troughs

Cut the Pipes to the required length, then plug them together and attach the Drip Heads or Nozzles. You can also attach the Drip Heads and Nozzles first and then put the Pipes together. In any case, everything should be connected and the pipe closed at the end before you start the system with water. If you want to change something later, you can flexibly rebuild the system.

Planning Sprinklersystem

The intelligent irrigation system that understands your lawn.

Watering your garden can be a breeze. Install an automatic Sprinklersystem, a reliable system that takes care of your lawn while you enjoy your free time. We'll show you how it's done. From planning by yourself to getting it done for you: Just see what suits you best. The MyGarden Online tool and our customer service team are trusted and helpful partners at your side.

A Plan yourself

Create an irrigation plan for your individual garden. You will find the instructions on the next pages. Everything is explained step by step. You will find a tear-out shopping list on page 89.

B Plan online

Create your watering schedule with the help of the GARDENA Sprinklersystem planner "myGarden" at www.gardena.com/mygarden

C Use the GARDENA Customer Service

No time or mood to plan it by yourself? Our GARDENA customer service will support you. Inquire also about the costs for your individual planning.

Contact service

Telephone +49 731/4 90-123
Fax + 49 731/4 90-249
www.gardena.com/contact

We ask for your understanding that we accept no liability for installations created by ourselves and no guarantee for costs and damages, that may arise during the implementation of the planning.

DO it YOURSELF

Plan it yourself - automatic watering in 8 steps

1. Plan system
2. Select Sprinklers
3. Determine Pipes
4. Determine Connections
5. Select control unit
6. Connect the system
7. Installing the system
8. Tips & hints for maintenance

And off you go!

On the following pages you will find out everything you need to know to irrigate your garden automatically. GARDENA provides the best solution due to our expertise, development of GARDENA technology and united passion for gardens. So that you can enjoy your automated lawn irrigation solution with GARDENA Sprinklersystem soon.

1. Plan the installation - Draw a blueprint of your garden

Blueprint

1. Draw a blueprint of your property on a scale of 1:100 (1 cm = 1 m) or on a scale of 1:200 (1 cm = 2 m).
2. Mark the water connection (e.g. tap, well, cistern)
3. Mark all areas that need to be irrigated

2. Select Sprinklers

With our innovative Sprinkler range you will make the right choice for your project.

SD Sprinklers

With the SD Sprinkler models you can automatically water smaller lawns. Thanks to the easy adjustable spray sector from 5-360°, the Sprinklers are also suitable for installation in narrow corner and small lawn areas. Please note: The SD models cannot be combined with other Sprinkler models on the same pipe.

MD Sprinklers

The models of the MD Sprinklers with spray distance of 2.5-7.5 m are suitable for irrigation of medium-sized areas. Its innovative rotary nozzle improves the water absorption into the soil, making it an water-efficient lawn irrigation solution for your garden. Since the water flow is similar to the T-Sprinklers or the OS 140, you can combine them on one pipe. For watering smaller plants at the edges of the lawn, a model with a longer riser is also available.

T Sprinkler

For the irrigation of larger areas, you can use the T-line models. They maximum spray distance is 11 m. Convenient installation with MD Sprinklers in one pipe makes planning even easier for you.

OS 140

For the irrigation of square or rectangular areas, the OS 140 is a simple and convenient solution. The Pop-up Oscillating Sprinkler is also suitable for particularly small and narrow areas and can water lawns from 2-140 m². Where several circle sprinklers and pipes had to be installed, one sprinkler is sufficient.

Overview Sprinklers

	SD models		MD models				T Sprinkler			OS 140
										
	Pop-up Sprinkler SD30	Pop-up Sprinkler SD80	Pop-up Sprinkler MD40	Pop-up Sprinkler MD80	Pop-up Sprinkler MD180	Pop-up Sprinkler MD40/300	Turbo-driven Pop-up Sprinkler T 100	Turbo-driven Pop-up Sprinkler T 200	Turbo-driven Pop-up Sprinkler T 380	Pop-up Oscillating Sprinkler OS 140
Watering areas	Up to 30 m²	Up to 80 m²	Up to 40 m²	Up to 80 m²	Up to 180 m²	Up to 40 m²	Up to 100 m²	Up to 200 m²	Up to 380 m²	2-140 m²
Watering sector	5-360°	5-360°	80-360°	80-360°	80-360°	80-360°	70-360°	25-360°	25-360°	–
Distance between Sprinklers	1.5-3 m	3-5 m	2.5-3.5 m	3.5-5 m	5-7.5 m	2.5-3.5 m	4-6 m	5-8 m	6-11 m	2-15 m und 1-9.5 m
Sprinkler distance	1.5-3 m	3-5 m	5-3.5 m	3.5-5 m	5-7.5 m	2.5-3.5 m	4-6 m	5-8 m	6-11 m	–

!!! Important advice

SD models

Due to the different water consumption, the SD models must not be installed with other sprinklers in the same pipe.

MD and T Sprinklers, Pop-up Oscillating Sprinkler

These sprinklers can be freely combined in the same pipe thanks to the same low water consumption.

What to pay attention to when planning

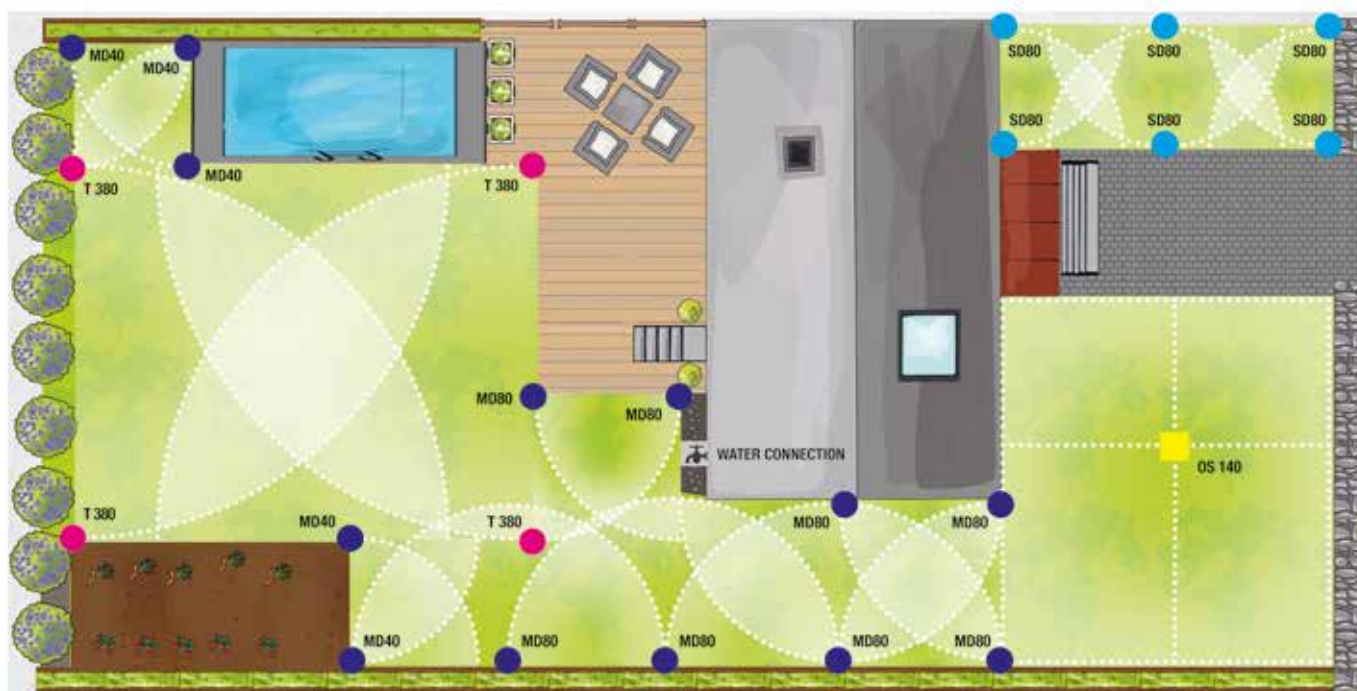

When positioning the Sprinklers, the goal is to achieve the most even water distribution possible in your garden. Each area should be watered twice and i.e. the spraying areas of two Sprinklers should overlap. This is called a 100% overlap. This way you achieve an accurate irrigation that is wind resistant.

- 100% overlap ensures that your lawn is watered as evenly as possible. Furthermore, more water is distributed in a shorter time period to achieve the most efficient and time-saving irrigation process. This also helps you to choose the optimal time for watering.
- If an even overlapping is not possible, you can also adjust the watering schedule by dividing the area into zones. More on this on page 80 Installation of pipes.
- First you position the Sprinklers in all the corners of your garden. Set them to the maximum possible spraying distance. Then position the Sprinklers at even intervals along the edge. For larger gardens you must also place Sprinklers in the centre to ensure a 100% overlap.
- We recommend installing MD and T-line Sprinklers where possible. These models can be combined with each other in the same pipe run. Here you can choose flexibly spray distances from 2.5 up to 11 m due to the matching precipitation rate of MD and T-Line sprinkler.
- We recommend SD Sprinklers for corners, where smaller spraying areas or spraying distances are necessary.
- The Square Sprinkler OS 140 does not require overlapping irrigation.

Blueprint

Take the blueprint of your garden and complete the following steps:

1. Select the appropriate Sprinklers for your garden areas.
2. Draw the Sprinklers into the blueprint. Keep in mind the hints provided for the sprinkler positioning.
3. Add the selected Sprinklers with the correct description and quantity in your shopping list.

3. Installation of pipes

A Determine connection capacity

Depending on the type and setting of the spray area, the Pop-up Sprinklers have different water consumption values. Our irrigation planner helps you to determine the water consumption for your individual Sprinklersystem. If the demand is higher than the amount of water supplied by your main water line, split up your system into several pipes. This is also referred to as irrigation channels. Your garden can be divided into several irrigation zones, and each zone is supplied with a separate pipe. The zones are irrigated independent from each other. To understand which connection value your main line can deliver, you need to determine the so called connection value. To do this, you have to calculate the amount of time needed to fill a 10-litre bucket with water.

Follow the below instructions:

1. Remove all connection parts, such as tap connectors or distributors from the water tap. For pumps, use at least a 3/4" hose.
2. Turn the tap on full blast or switch on your pump to fill a 10 litre bucket with water.
3. Track the time needed to fill the bucket (10 litres).

Please note: If the filling time exceeds 30 seconds, the installation of an irrigation system is not possible.

B Determine distance allowance

The bigger your garden, the longer the pipes can be. Since the water in the pipes has minimal frictional losses, this must be taken into account in the calculation:

1. How many metres in distance are between the tap or pump and the furthest located sprinkler? Make a note of this number.
2. For every 25 m of pipe length, you should now add 1 second to the previously determined bucket filling time. See example at point C.

Please note: Add 3 second to previously determined bucket filling time when the filling time is less than 14 seconds and want to use a Water Control, an Automatic Water Distributor or 2- or 4-way Distributor.

C Connection value

Now add up the values for the bucket filling time and the distance allowance previously determined.

Seconds	bis 9	10–13	14–19	20–24	25–30
Connection value	100	80	60	40	20

Example

Measured bucket filling time
= 10 seconds

Distance from water connection
to the furthest Sprinkler (here 39.5 m)
= 2 seconds

➡ Sum: $10 + 2 = 12$ seconds
➡ Connection value according to table above = 80

Connection with GARDENA Pumps

As an alternative to the domestic water connection, you can also operate the Sprinklersystem with a Pump. Using rain water is more sustainable and helps to save drinking water, e.g. by watering with rainwater from a cistern. GARDENA offers a comprehensive range of different models to suit your individual needs.

For the operation of your Sprinklersystem with a Pump you also need to determine a bucket filling time.
The following overview shows the filling times of various GARDENA models:

Gardenpumps	Delivery head up to		
Art. No.	3 m	5 m	7 m
9057	9	12	16
9058	8	11	15
9059	7	10	14

Submersible Pressure Pumps	Delivery head up to			
Art. No.	3 m	5 m	7 m	10 m
1771	9.9	10.3	11.3	12.6
1773	9.0	9.3	9.7	10.3
1766	11.6	12.5	14.2	16.8
1476	10	11	12	13
1489	11	12	13	14
1492	10	11	12	13
1499	10	11	12	13

Automatic Home & Garden Pumps smart	Delivery head up to		
Automatic Home & Garden Pumps	3 m	5 m	7 m
Art. No.	3 m	5 m	7 m
1757	20	28	40
1758	12	15	22
1759, 19080, 19106	9	12	18
1760	7	10	14

If you are using a pump from another manufacturer, you can connect it with the help of the GARDENA Profi System Connection Set (Art. No. 1505). an approx. 1 m long piece of 19 mm (3/4") hose to measure the filling time for your pump.

D Determine the number of Pipelines (irrigation channels)

By determining the connection value in point C, you know the maximum amount of water your source can deliver. Each Sprinkler needs a minimum amount of water for optimal water distribution. We have already established the corresponding consumption values with a simple calculation (see overview on pages 78 & 79). However, if you have want to install more Sprinklers than the water source can handle, then you should divide your garden into so-called irrigation zones. Each zone will have a separate pipe and the irrigation schedule for each zone takes place consecutively one after the other. To plan the irrigation zones, proceed as follows.

1. Enter the consumption values for each Sprinkler in your blueprint (cf. page 79 or 82).
2. Divide your garden into zones and draw pipes starting from the water supply.
Try to group as many Sprinklers as possible in one area of the garden. Note here:
 - The combinability of Sprinklers in one Pipe (see page 77 above „Important notes“).
 - The connection value: Only plan as many Sprinklers per Pipeline that the connection value is not exceeded (see sample example on page 82).
3. Measure how many metres of pipe you need for your underground network.
See sample and garden sketch on page 82.

Consumption values of the Sprinklers

	SD models		MD models				T Sprinkler			OS 140
	Pop-up Sprinkler SD30	Pop-up Sprinkler SD80	Pop-up Sprinkler MD40	Pop-up Sprinkler MD80	Pop-up Sprinkler MD180	Pop-up Sprinkler MD40/300	Turbo-driven Pop-up Sprinkler T 100	Turbo-driven Pop-up Sprinkler T 200	Turbo-driven Pop-up Sprinkler T 380	Pop-up Oscillating Sprinkler OS 140
Water in areas m ²	30	80	40	80	180	40	100	200	380	140
0-90°	6	10	2	4	6	2	7	9	15	22
91-180°	10	16	4	6	12	4	10	13	20	
181-270°	13	22	6	9	17	6	14	17	25	
271-360°	17	27	8	13	22	8	17	20	30	

Example

Determine supply Pipes on the basis of the Sprinkler consumption values

The connection value (here e.g. 80) must not be higher than the sum of the Sprinkler consumption values!

Pipe length per line

Pipe 1 $10 \text{ } \frac{1}{4} + 10 \text{ } \frac{1}{4} + 16 \text{ } \frac{1}{2} + 16 \text{ } \frac{1}{2} + 10 \text{ } \frac{1}{4} + 10 \text{ } \frac{1}{4} = 72$
 $- = 50 \text{ m}$

Pipe 2 $22 \text{ } \blacksquare + 4 \text{ } \frac{1}{4} + 4 \text{ } \frac{1}{4} + 6 \text{ } \frac{1}{2} + 6 \text{ } \frac{1}{2} + 6 \text{ } \frac{1}{2} + 6 \text{ } \frac{1}{2} + 2 \text{ } \frac{1}{4} = 56$
 $- = 49 \text{ m}$

Pipe 3 $4 \text{ } \frac{1}{4} + 4 \text{ } \frac{1}{4} + 15 \text{ } \frac{1}{2} + 2 \text{ } \frac{1}{4} + 15 \text{ } \frac{1}{2} + 15 \text{ } \frac{1}{2} + 15 \text{ } \frac{1}{2} + 2 \text{ } \frac{1}{4} + 2 \text{ } \frac{1}{4} + 2 \text{ } \frac{1}{4} = 76$
 $- = 55 \text{ m}$

Expand the blueprint of your garden

1. Make a note of the connection value you have determined.
2. Now draw in the required Pipes. Take into account that the connection value must not be higher than the sum of the sprinkler consumption values.
3. Enter the Pipe lengths and add them up. There are Connection Pipes in 10 m, 25 m and 50 m units.

4. Determine Connections and Fittings

Now it's time for the Pipe Connections, Sprinkler Connections and Drain Valves.

A Pipe Connections

Now determine the Connectors for the Pipe Connections and transfer the defined quantities into your shopping list. See product overview page 61.

Connector
to extend

L-Piece
to change direction

T-Piece
to change direction

End-Piece
to Pipe end

B Frost protection

To protect your Sprinklersystem from frost damage, install at least one Drain Valve per Pipe. You install the valve at the lowest points of the pipe. See product overview on page 63. Installation instructions page 87.

**T-Piece with
Drain Valve**

**End piece with
Drain Valve**

C Sprinkler Connection

Now determine the Connecting Parts for the Sprinklers and transfer them to your shopping list. Please pay attention which connector fits your Sprinkler. See product overview page 61 and 78/79.

Sprinkler connection options for flexible installation

Patented Connection Technology "Quick & Easy" **1** or in combination with the flexible Sprinkler Connections 2739 and 2740 **2**. For flexible installation of the Turbo-driven Pop-up Sprinklers and Pop-up Sprinklers. Different options are possible: Within the run of the pipe with T-Piece, corner connection with Angle Piece or end connection with L-Piece. As alternative to the T-Piece: **3** Saddle Clamp for mounting without pipe disconnection.

Fixed Connection

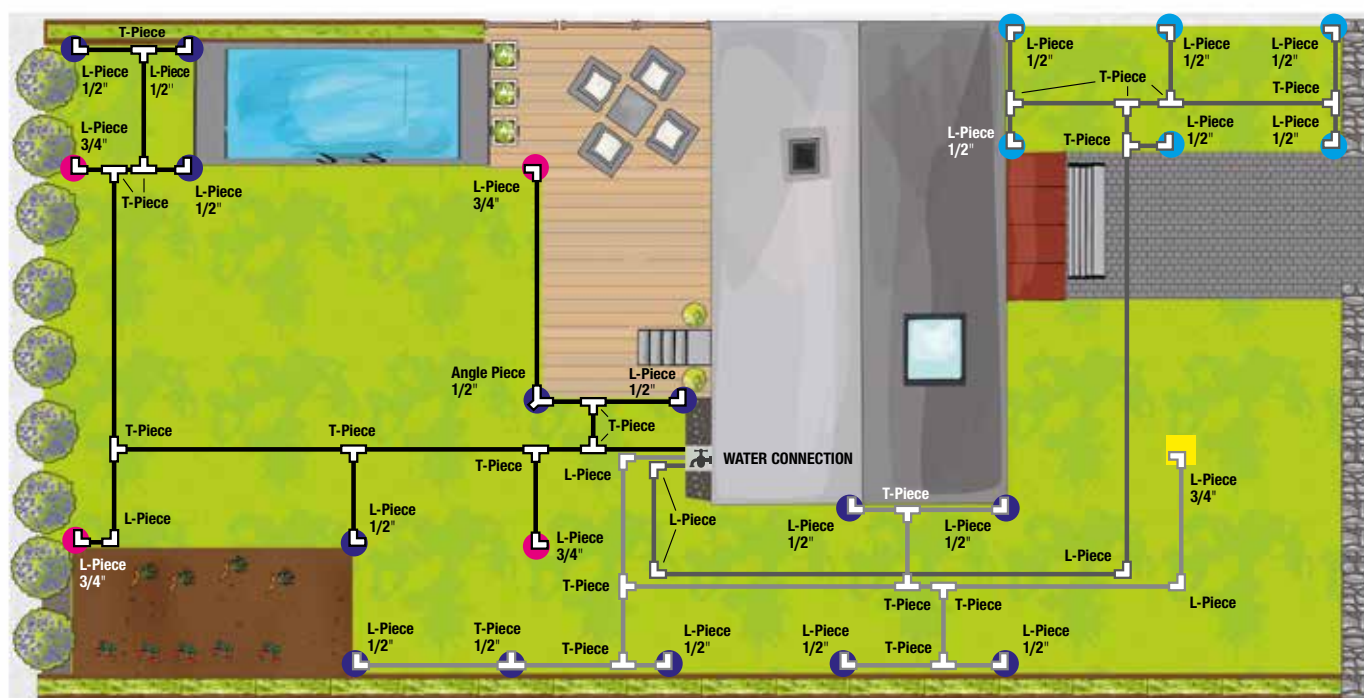

Flexible Connection

Expand the blueprint of your garden

1. Select suitable Pipe Connections and draw them on the plan and transfer them to the shopping list with the required quantities.
2. Select suitable Sprinkler Connections and draw them into the plan and transfer them to the shopping list with the required quantities.

5. Select control unit

Now it's time to choose the right controller for your irrigation - the heart of the Sprinklersystem.

The Sprinklersystems can be equipped with single or multi-channel controls. Multi-channel controls are always necessary if you want to water two or more Pipes / zones in your garden independent of each other. This is necessary for larger gardens or watering areas with different water requirements. (see the information on page 81, point D).

With Power supply

Up to 6 irrigation channels

Up to 6 irrigation channels A 24 V Irrigation Valve is connected in front of each irrigation Pipe. (art. no. 1278) Via the GARDENA Irrigation Control, the Irrigation Valves are receiving the impulse to open or close up to 6 irrigation lines - depending on the type.

The following watering controls are available:

- Classic Irrigation Control System 4030 for up to 4 channels
- Classic Irrigation Control System 6030 for up to 6 channels
- smart Irrigation Control for up to 6 channels, programmable via the GARDENA smart App

Further information on the multi-channel control can be found on pages 48 and 64.

No power supply

Any number of irrigation channels

The entire configuration is done via the GARDENA Bluetooth® App. The corresponding signals are to the Irrigation Valves 9 V Bluetooth® (Art. No. 1285). The control unit (art. no. 1287) is installed directly on the Valve. These open and close based on the settings made via the App. You can place the Valves anywhere in the garden. A new 9 V battery is enough for a whole season.

Further information on the multi-channel control can be found on pages 48 and 64.

6. Connect the system

The assembly is very easy thanks to the Quick & Easy technology. You will find a detailed product overview on pages 61 and 62. Transfer all required products to your shopping list.

We recommend the following products for easier installation of the system:

Profi System Connection Set

Complete set for connecting Pipeline and Sprinklersystem to the water supply.
The set includes all components for the connection between the water tap and the Connecting Point.

Connecting Point

The Connecting Point is the ideal product for the transfer from the water supply (above ground) to the underground Pipes for Pipeline or Sprinklersystem.

Pressure Regulator

For better protection of your Sprinklersystem, we recommend installation of the Pressure Regulator. The best is to install the Pressure Regulator underground in the small valve box (article no. 1290) in front of the electric Valves. The Pressure Regulator fulfils two tasks:

1. High water pressure

If the water pressure from your connection is higher than 4 bar, the installation of the Pressure Regulator is required. This reduces the water pressure to max. 3.1 bar. If you have any questions about the pressure or about the correct connection to the domestic water supply ask your sanitary company if necessary.

2. Water filter

The integrated filter holds back dirt particles and the Sprinklersystem is protected from foreign objects. Especially if you use a Pump to supply water, impurities can occur which can impair its function. Due to the installation in the Valve Box, the Pressure Regulator is easily accessible for manual cleaning of its filter.

Valve-Box Small

The Box can be used to install the Pressure Regulator. This protects it and also makes it easily accessible for cleaning.

1" Connector

For convenient installation and removal of the Pressure Regulator and valve boxes to the underground Pipes.

Valve Box V3

Up to 3 Irrigation Valves 9 V or 24 V can be installed in the Valve Box V3. This makes them easily accessible as well as protected.

Various Connection Fittings

For connection to the Connection Point, Water Station, Valves and Valve Boxes, or for direct connection to the house installation.

7. Installing the system

Just a few more steps to fully automated watering.

This is how easy it is to install your Sprinklersystem professionally.*

A Lay out all the parts in your garden according to the plan. Start at the beginning of your irrigation system.

Tip: If you unroll the Pipes 1 to 2 hours before and lay them out in the sun, they can be easily straightened.

B Cut the Pipes to the right length according to the plan. Make sure that no soil gets into the pipe. If necessary, chamfer the pipe, i.e. remove unclean cut edges. For straight Pipe cuts in just one turn, use the GARDENA Pipe Cutter for cutting the Connecting Pipes (Art. No. 2727).

E Important! Now check whether your Sprinklersystem is tight. To do this, do a test run before you install the system underground. If the Sprinklersystem is tight, go on to step F. If the Sprinklersystem is not tight, check that the Pipes are really inserted into the connectors as far as they will go.

F Use a spade to dig v-shaped trenches approx. 20-25 cm deep. To do this, carefully remove the turf and dig out the trench. Remove the stones from the trench.

Tip: Mow the lawn and water it beforehand. Then it's easier.

I Now pour the soil back in, put the turf on top and tread it down. If you water the soil and the turf first, everything will grow faster. And in 2 to 3 weeks you won't see any more of the installation.

C Now connect the elements. Push the Pipes approx. 6 cm into the connector over the O-ring. This creates a watertight connection. Caution: After approx. 4 cm there is a sealing ring. Please insert the tube further into the opening at this point.

D Now adjust the spray direction, the spray range and the spray width on the sprinkler. The settings are differently depending on the model. You can find more information on the labels on the Sprinklers themselves.

G Now place the Pipes with connectors and Sprinklers in the trench. All Sprinklers and Nozzles must be installed flush with the ground surface. The Nozzle head including recessed grip should be above the ground surface for regular cleaning.

H Install the Drain Valves at the lowest points of the system. The difference in height between the Drain Valves must not exceed 2 m on slopes. If necessary, install several drainage valves on the slope. In order to improve drainage and protect the Drain Valve, install it in a seepage pack of washed coarse gravel (about coarse gravel (approx. 20 x 20 x 20 cm). Before installing the Drain Valves, rinse the system to remove any dirt that may have got into the system during installation. The Drain Valves opens automatically after irrigation, as soon as the water pressure is below 0.2 bar and drains the pipe.

* If you carry out the installation yourself, we ask for your understanding that we assume no liability and no guarantee for costs and damages that may arise during the implementation of the planning.

8. Tips & hints for maintenance

Here are some tips to help you enjoy your system for a long time.

Pressure Regulator

If the water pressure from your connection is higher than 4 bar, it is recommended to install the Pressure Regulator (Art. No. 8200). The integrated filter retains dirt particles.

Frost protection

Before the frost arrives, disconnect the system from the supply Pipe. Simply observe the additional frost notes for the products.

Transition from 19 mm or 32 mm to 25 mm

Pipe Connections

You have already installed your GARDENA Sprinklersystem before 2005? You want to replace or extend it now?

- Use the Adapter Piece (Art. No. 1513) for the transition from 19 mm to 25 mm pipes, use the adapter piece (Art. No. 1513) with the Connector 25 mm x 1" male thread (Art. No. 2763).
- Use the Reducing Connector (Art. No. 2777) to connect the 32 mm Connection Pipe to the 25 mm Pip

Permanent pressure resistant connection

For a connection that is resistant to permanent pressure, the connection between the tap and the Connecting Point (Art.-No. 8262) should be made via a 3/4" hose and 2 Adapter Pieces (Art.-No. 1513).

Most used tools

secateurs or GARDENA Cutting Tool to cut Pipes, screwdriver (slotted or cross, not available from us) to adjust the Sprinklers, spade to bury Pipes.

Combination V3- with V1 Valve Box

The V3 Valve Box is connected to the water connection. You can also combine it with a V1 Valve Box. To do this, branch of the Pipe and connect it to the V1 Valve Box.

Tip: If you install several Valve Boxes next to each other, we recommend to screw the Valve Boxes together on a wooden board.

Combination of V3 with V3 Valve Box

V3 Valve Boxes can be easily combined with each other, assembled and disassembled. This is ensured by the telescopic screw connection.
